

App Initialization

Once the app layout is set up, we will need to initialize the app.

The app initialization code is defined inside `/assets/custom/js/init.js` file.

Define app parameters inside `var app = new Framework7({`

 For app initialization parameters visit here — <https://v3.framework7.io/docs/app.html>

If you want to run any functions just after the app has been initialized, call them inside `app.on('init', function() { event handler.`

After the initialization parameters have been defined, we need to manually call the app initialization method inside `index.html` file.

In the `index.html` file, this code is added inside the `<script>` tag just before the closing `</body>` tag.

```
(function() { app.init(); } )();
```
