Configuration

The configuration variables related to your app are stored inside `/assets/custom/js/config.js` file.

You can store configuration variables such as API keys related to third-party services inside this file.

The example structure of storing variables is —

```
1  window.config.facebook {
2      appId: '12345679098765431'
3  }
```

You can access these variables from inside JavaScript or from inside the HTML template.

```
1  // Accessing from inside JavaScript
2  console.log(window.config.facebook.appId);
3  // Or you can also access this way, once your app is initialized.
4  console.log(app.data.config.facebook.appId); // This is the recommended way
```

```
1  <!-- Accessing from inside HTML template -->
2  <template>
3      <div>{{$root.config.facebook.appId}}</div> <!-- After parsing, the output will
4  </template>
```
